

### Intermediate Milestones:

- Convert HTML/CSS website into React
- Create lo-fi and mid-fi mockups for new page
- Define new features

### Lo-fi mockup, shopping cart page

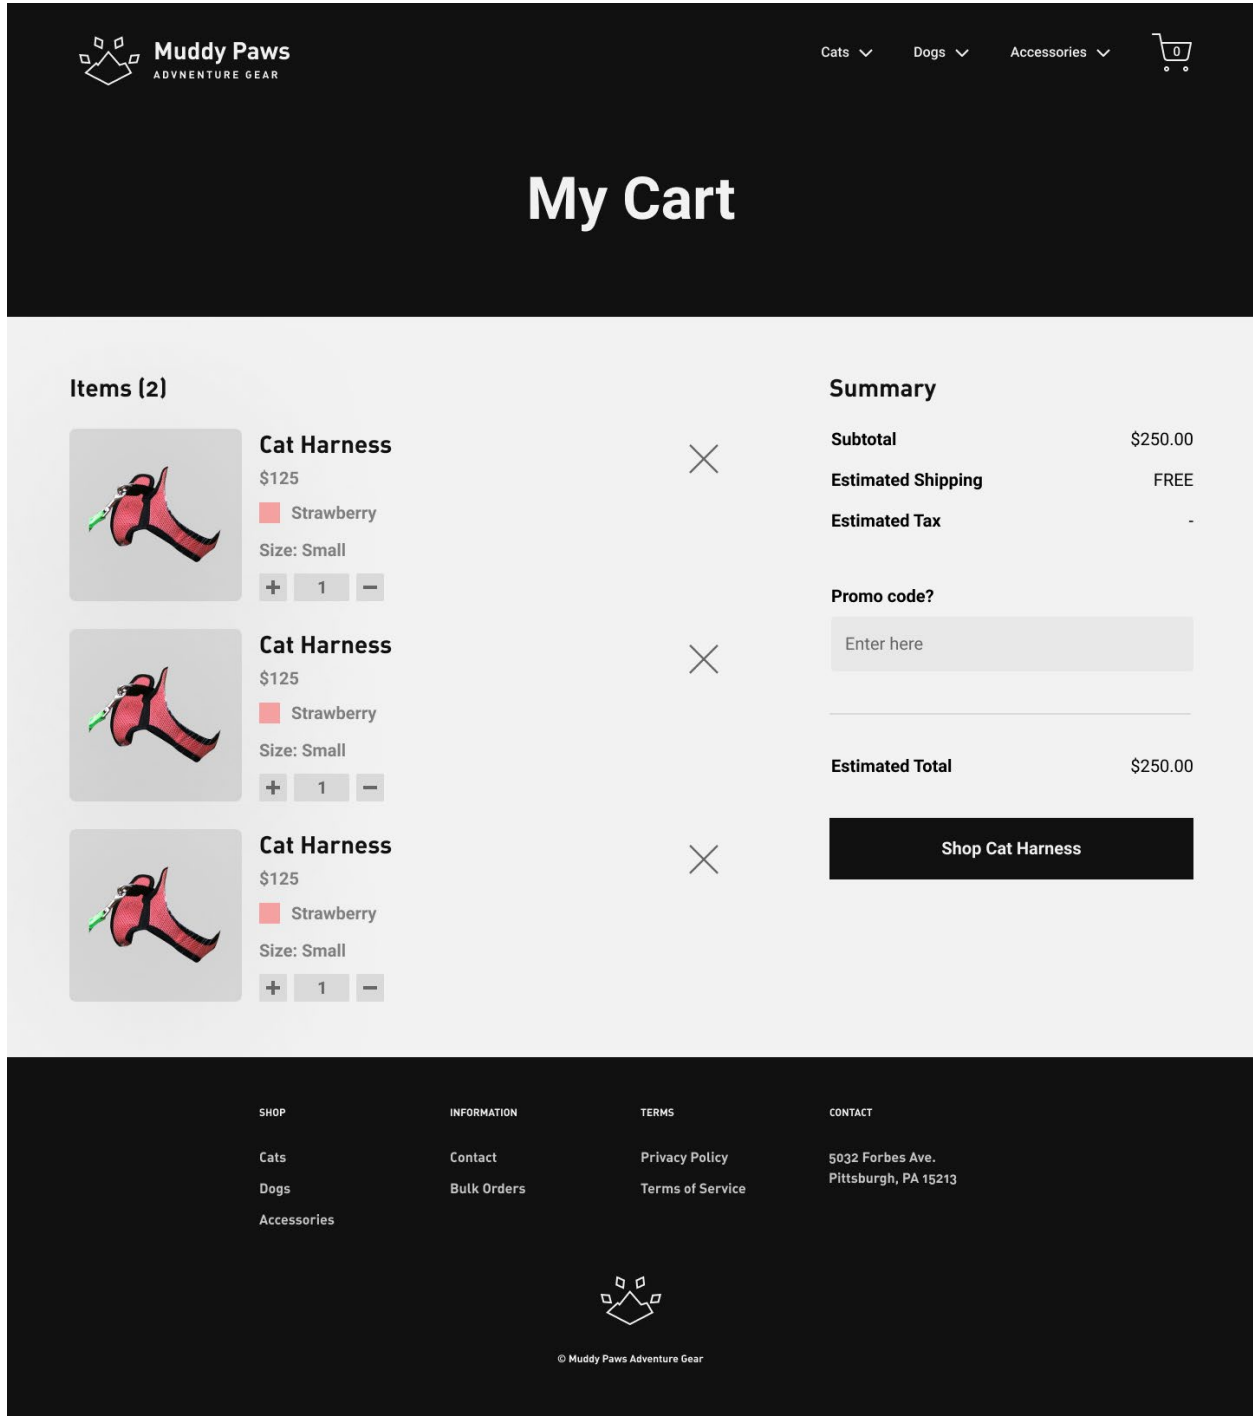

Sketch for the beginning of the shopping cart page. The design choice is informed by many other product pages on other websites, showing the same information as the product details page but in a condensed format. The right has summary information and a promo code field where users will checkout after reviewing their order details on the left.

Since quantity may likely be an error, it's important for users to be able to adjust this parameter from the cart page following Nielson's guidelines. The other items, however, are not editable from the cart page because they require more consideration from the user.

## Hi-fi mockup, shopping cart page

Rationale is listed in the lo-fi section. This is a preliminary mockup of what it would look like with the rest of the site.

**CSS/HTML prototype, checkout page**

**Other Helpful Notes**

- The new shopping cart page is reachable from the main page via the shopping cart icon.
- The shopping cart icon displays the items the cart and updates when an item is added
- The details page for harness products are fully operational as requested by HW6A
- To do: cart item removal (items listed in HW6B), add custom images for the food/water storage packs
